

How to Measure your Spa for a Custom Replacement Spa Cover

It is very important that you take accurate measurements to ensure your new cover will properly fit your spa. The diagrams below will help you to determine where to take your measurements from. It is recommended that someone assist you in holding the tape measure while you measure.

Measuring outer dimensions and lip height (skirt/flap length)

Measuring the corner radius

Using 2 rulers, or a carpenter's square (preferred method) lay the measuring tool against the spa shell as shown in the diagram at the right. Measure from where the curve breaks (Point A) to where the measuring tools intersect (Point B). This will be your radius measurement.

Please be sure to print this page at actual size.
Do not reduce or increase the size of the page to fit a particular paper.
These measurements will not be accurate if this is not printed at 100%.

***To ensure accuracy, before you use this template,
confirm that the the longest (horizontal) black line measures 10"
And that the shortest (vertical) line measures 7.5"***

If your radius falls in between two measurements, always choose the smaller dimension.
For example: your spa radius falls in between 5" & 6". Submit the 5" measurement to
ensure your cover will fit over the corner of your spa.
